

Java™ API for XML Web Services 2.1 Change Log

October 6, 2006

Description

Maintenance revision of the Java API for XML Web Services, version 2.1. The main purpose of this change is to incorporate the WS-Addressing[32,33,34] functionality into JAX-WS, although some other minor additions will be proposed.

Maintenance Leads

Doug Kohlert, Sun Microsystems, Inc.

Arun Gupta, Sun Microsystems, Inc.

Feedback

Comments should be sent to jsr224-spec-comments@sun.com

Proposed changes

1 Introduction

1.1 Add the following at the end of the JAXB paragraphs

JAX-WS 2.1 requires JAXB 2.1 which is being developed in parallel with JAX-WS 2.1.

1.5 Add the following prefix definitions

Add the following prefixes to Table 1.1

Prefix	Namespace	Notes
wsa	http://www.w3.org/2005/08/addressing	The namespace for the WS-Addressing 1.0 schema [33]
wsaw	http://www.w3.org/2006/05/addressing/wsdl	The namespace for the WS-Addressing 1.0 – WSDL Binding schema[32]

2 WSDL 1.1 to Java Mapping

Add the following conformance requirement to Chapter 2

Conformance (WSDL Addressing Support): An implementation MUST support the mapping of WS-Addressing 1.0 – WSDL Binding[32] to Java.

2.2 Add XmlSeeAlso requirements

A WSDL may define additional types via type substitution that are not referenced by a service directly but may still need to be marshalled by JAX-WS. The

`javax.xml.bind.XmlSeeAlso` annotation from JAXB is used on the generated SEI to specify any additional types from the WSDL.

Conformance (`javax.xml.bind.XmlSeeAlso` required): An SEI generated from a WSDL that defines types not directly referenced by the `Port` MUST contain the `javax.xml.bind.XmlSeeAlso` annotation with all of the additional types referenced either directly or indirectly.

Figure 2.1 shows how an SEI can be annotated with `javax.xml.bind.XmlSeeAlso`. This figure shows some of the types that may have been created while importing a WSDL and the different approaches to annotating the SEI.

```
package example;
public class A { ... }
```

```
package example1;
public class B extends A { ... }
```

```
package example2;
public class C extends A { ... }
```

```
@WebService
public interface MyService {
    public A echo(A a);
}
// Directly annotated SEI with classes B and C
@WebService
@XmlSeeAlso({B.class, C.class})
public interface MyService {
    public A echo(A a);
}
```

```
// Indirectly annotated SEI using generated JAXB
// ObjectFactories
@XmlSeeAlso({example1.ObjectFactory.class,
example2.ObjectFactory.class})
```

```
public interface MyService {
```

```

        public A echo(A a);
    }

```

Figure 2.1 XmlSeeAlso annotation uses

2.3 Add mapping of `wsa:Action` and `wsa:FaultAction`

Methods generated from `wsdl:input` and `wsdl:output` messages that contain a `wsaw:Action` attributes MUST be annotated with `javax.xml.ws.Action`. See section 7 for more information on these annotations.

Conformance (javax.xml.ws.Action): A mapped Java method MUST be annotated with a `javax.xml.ws.Action` annotation if the `wsdl:input` or `wsdl:output` elements contain a `wsaw:Action` attribute. If the `wsdl:input` element contains a `wsaw:Action`, the value of this attribute MUST be set to the `javax.xml.ws.Action.input` element. If the `wsdl:output` element contains a `wsaw:Action`, the value of this attribute MUST be set to the `javax.xml.ws.Action.output` element.

Methods generated from `wsdl:fault` messages that contain a `wsaw:Action` attributes MUST be annotated with `javax.xml.ws.FaultAction`. See section 7 for more information on this annotation.

Conformance (javax.xml.ws.FaultAction): A mapped Java method MUST be annotated with a `javax.xml.ws.FaultAction` annotation if the `wsdl:fault` elements contain a `wsaw:Action` attribute. The `javax.xml.ws.FaultAction.value` is taken directly from the value of the `wsaw:Action`. The `javax.xml.ws.FaultAction.className` MUST be the exception class name associated with this `wsdl:fault`.

Figure 2.2 shows the mapping of a `wsdl:operation` containing input, output, and fault elements with `wsaw:Action` attributes.

```

<operation name="addNumbers">
  <input message="tns:add" wsaw:Action="inAction"/>
  <output message="tns:addResponse" wsaw:Action="outAction"/>
  <fault name="addFault" message="tns:addFault"
wsaw:Action="faultAction"/>
</operation>

// the mapped Java method will be

@Action(input="inAction",
        output="outAction",
        fault= {
            @FaultAction(className=AddFaultException.class,
                           value="faultAction")
        })
public int addNumbers(int number1, int number2) throws
AddFaultException;

```

Figure 2.2 Mapping of `wsaw:Action`

2.3.1 Add the following to section 2.3.1

When generating an SEI from WSDL and XML schema, occasionally ambiguities occur on what XML infoset should be used to represent a method's return value or parameters. In order to remove these ambiguities, JAXB annotations may need to be generated on methods and method parameters to assure that the return value and the parameters are marshalled with the proper XML infoset. A JAXB annotation on the method is used to specify the binding of a methods return type while an annotation on the parameter specifies the binding of that parameter. If the default XML infoset for the return type or parameters correctly represents the XML infoset, no JAXB annotations are needed.

Conformance (use of JAXB annotations): An SEI method **MUST** contain the appropriate JAXB annotations to assure that the proper XML infoset is used when marshalling/unmarshalling the return type. Parameters of an SEI method **MUST** contain the appropriate JAXB annotations to assure that the proper XML infoset is used when marshalling/unmarshalling the parameters of the method.

2.4 Change the first sentence of this section

Change:

“Mapping of XML Schema types to Java is described by the JAXB 2.0 specification[10].”

to:

“Mapping of XML Schema types to Java is described by the JAXB 2.1 specification[35].”

2.4.1 Add section 2.4.1 W3CEndpointReference

JAXB 2.1 by default does not map `wsa:EndpointReference` to the `javax.xml.ws.wsaddressing.W3CEndpointReference` class. However, for JAX-WS developers to fully utilize the use of a `wsa:EndpointReference`, JAX-WS implementations **MUST** map the `wsa:EndpointReference` to `W3CEndpointReference`. JAXB 2.1 provides a standard customization that can be used to force this mapping.

Conformance (javax.xml.ws.wsaddressing.W3CEndpointReference): Any schema element of the type `wsa:EndpointReference` **MUST** be mapped to `javax.xml.ws.wsaddressing.W3CEndpointReference`.

2.7 Add description of new `getPortName(WebServiceFeatures...)` method

Change the following sentence from:

“For each port in the service, the generated client side service class contains the following methods, one for each port defined by the WSDL service and whose binding is supported by the JAX-WS implementation:”

To:

“For each port in the service, the generated client side service class contains the following methods, two for each port defined by the WSDL service and whose binding is supported by the JAX-WS implementation:”

getPortName(WebServiceFeatures... features) One required method that takes a variable-length array of `javax.xml.ws.WebServiceFeatures` and returns a proxy that implements the mapped service endpoint interface. The method generated delegates to the `Service.getPort(QName portName, Class<T> SEI, WebServiceFeatures... features)` method passing it the port name, the SEI and the features. The value of the port name **MUST** be equal to the value specified in the mandatory `WebEndpoint` annotation on the method itself.

2.7 Change the following sentence

Change

“An application MAY customize the name of the generated method for a port using the `jaxws:method` binding declaration defined in section 8.7.8.”
to

“An application MAY customize the name of the generated methods for a port using the `jaxws:method` binding declaration defined in section 8.7.8.”

2.7.1 Fix the `getPortName()` samples so they take a `QName` for `portName`

The samples in the 2.0 specification was incorrectly passing just the local name of the `portName`, not the entire `QName`. This change only fixes the samples and does not change the APIs.

```
@WebEndpoint(name="StockQuoteHTTPPort")
public StockQuoteProvider getStockQuoteHTTPPort() {
    return (StockQuoteProvider)super.getPort(
        new QName("http://example.com/stocks","StockQuoteHTTPPort"),
        stockQuoteProvider.class);
}

@WebEndpoint(name="StockQuoteSMTPPort")
public StockQuoteProvider getStockQuoteSMTPPort() {
    return (StockQuoteProvider)super.getPort(
        new QName("http://example.com/stocks", "StockQuoteSMTPPort"),
        StockQuoteProvider.class);
}
```

2.7.1 Add the `getPortName(WebServiceFeatures...)` methods to the example

```
@WebEndpoint(name="StockQuoteHTTPPort")
public StockQuoteProvider getStockQuoteHTTPPort(WebServiceFeatures...
                                                features) {

    return (StockQuoteProvider)super.getPort(
        new QName("http://example.com/stocks","StockQuoteHTTPPort"),
        stockQuoteProvider.class,
        features);
}
```

```

}

@WebEndpoint(name="StockQuoteSMTPPort")
public StockQuoteProvider getStockQuoteSMTPPort(WebServiceFeatures...
                                              features) {
    return (StockQuoteProvider)super.getPort(
        new QName("http://example.com/stocks", "StockQuoteSMTPPort"),
        StockQuoteProvider.class,
        features);
}

```

3 Java to WSDL 1.1 Mapping

Add the following conformance requirement to Chapter 3

Conformance (WSDL Addressing Support): An implementation MUST support the mapping of Java to WS-Addressing 1.0 – WSDL Binding[32].

3.3 Add mapping of `javax.xml.ws.soap.AddressingFeature`

Classes annotated with the `javax.xml.ws.BindingType` annotation with the `javax.xml.ws.soap.AddressingFeature` enabled MUST result in the `wsaw:UsingAddressing` extensibility element on the `wsdl:binding`.

Conformance (javax.xml.ws.soap.AddressingFeature): A Java class that is annotated with the `javax.xml.ws.BindingType` annotation that contains the `javax.xml.ws.soap.AddressingFeature` with the `enabled` element set to `true`, MUST result in the addition of a `wsaw:UsingAddressing` extensibility element to the `wsdl:binding` element and it MUST NOT have the `wsdl:required="true"` attribute. If the `required` `FeatureParameter` of the `AddressingFeature` has a value of `true`, then the `wsaw:UsingAddressing` extensibility element MUST contain the `wsdl:required="true"` attribute. If the `BindingType.value` is not compatible with this feature an error MUST be given. The JAX-WS runtime MUST also use `Addressing` headers. If the `enabled` element is set to `false`, then `wsaw:UsingAddressing` element MUST NOT be generated and the JAX-WS runtime MUST NOT use `Addressing` headers.

Figure 3.1 shows the mapping of a `BindingType` annotation with the `AddressingFeature` enabled.

```

@BindingType(SOAPBinding.SOAP11HTTP_BINDING,
            features={@Feature(AddressingFeature.ID)})
public class AddNumbersImpl {
    ...
}

```

```

<definitions
  xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/"

```

```

    ...>
    ...
<wsdl:binding ...>
    <wsaw:UsingAddressing wsdl:required="false"/>
    ...
</wsdl:definitions>

```

Figure 3.1 Mapping of AddressingFeature

3.4 Add the following just prior to section 3.4.1

Multiple SEIs in the same package may result in name clashes as the result of sections 3.6.2.1 and 3.7 of the specification. Customizations may be used to resolve these clashes. See sections 7.2, 7.3 and 7.4 for more information on these customizations.

3.5 Add mapping of `javax.xml.ws.Action` and `javax.xml.ws.FaultAction`

Conformance (javax.xml.ws.Action): A Java method annotated with the `javax.xml.ws.Action.input` annotation element MUST result in the addition of a `wsaw:Action` extensibility element to the `wsdl:input` element with the `wsaw:Action.value` equal to `javax.xml.ws.Action.input`. A Java method annotated with the `javax.xml.ws.Action.output` annotation element MUST result in the addition of a `wsaw:Action` extensibility element on the `wsdl:output` element with the `wsaw:Action.value` equal to `javax.xml.ws.Action.output`.

Conformance (javax.xml.ws.FaultAction) A Java method annotated with the `javax.xml.ws.FaultAction` annotation element MUST result in the addition of a `wsaw:Action` extensibility element on the `wsdl:fault` element that corresponds to the Exception specified by `javax.xml.ws.FaultAction.className` with the `wsaw:Action.value` equal to `javax.xml.ws.FaultAction.value`.

Figure 3.2 shows the mapping of `javax.xml.ws.Action` and `javax.xml.ws.FaultAction` to a `wsdl:operation`.

```

@Action(input="inAction",
        output="outAction",
        fault={
            @FaultAction(className=AddNumbersException.class,
                          value="faultAction")
        })
public int addNumbersFault(int number1, int number2)
    throws AddNumbersException

```

```

<operation name="addNumbersFault">

```

```

<input wsaw:Action="inAction" message="tns:addNumbersFault"/>
<output wsaw:Action="outAction"
        message="tns:addNumbersFaultResponse"/>
<fault name="AddNumbersException"
        message="tns:AddNumbersException"
        wsaw:Action="faultAction"/>
</operation>

```

Figure 3.2 Mapping of Action and FaultAction to wsdl:operation

3.6 Add the following to section 3.6 Method Parameters and Return Type

Since JAX-WS uses JAXB for its data binding, JAXB annotations on methods and method parameters MUST be honored. A JAXB annotation on the method is used to specify the binding of a method's return type while an annotation on the parameter specifies the binding of that parameter.

Conformance (use of JAXB annotations): An implementation MUST honor any JAXB annotation that exists on an SEI method or parameter to assure that the proper XML infoset is used when marshalling/unmarshalling the return value or parameters of the method.

3.6.2 Change the first sentence of this section

Change the sentence:

“JAXB defines a mapping from Java classes to XML Schema constructs.”

to:

“JAXB 2.1 defines a mapping from Java classes to XML Schema constructs.”

3.7 Add the following to section 3.7

Service specific exceptions are defined as all checked exceptions except `java.rmi.RemoteException` and its subclasses.

Conformance (java.lang.RuntimeExceptions and java.rmi.RemoteExceptions)
java.lang.RuntimeException and java.rmi.RemoteException and their subclasses MUST NOT be treated as service specific exceptions and MUST NOT be mapped to WSDL.

4 Client APIs

4.2 Add getting of an EndpointReference

A web service client can get an `javax.xml.ws.EndpointReference` from a `BindingProvider` instance that will reference the target endpoint.

Conformance (Required BindingProvider getEndpointReference): An implementation MUST be able to return an `javax.xml.ws.EndpointReference` for the target endpoint if a

SOAP binding is being used. If the `BindingProvider` instance has an associated WSDL, and the binding is either SOAP 1.1/HTTP or SOAP 1.2/HTTP, then the WSDL MUST be inlined in the `wsa:Metadata` and the `wsa:Metadata` MUST also contain the `wsaw:ServiceName` element with the `wsaw:EndpointName` attribute. The `wsaw:InterfaceName` MAY be present. If the binding is XML/HTTP an `java.lang.UnsupportedOperationException` MUST be thrown.

4.2.3 Add additional `getPort` methods

Add the following `getPort` methods to the methods of a `Service` instance.

T `getPort(Class<T> sei, WebServiceFeatures... features)` Returns a proxy for the specified `sei`, the `Service` instance is responsible for selecting the port (protocol binding and endpoint address). The specified `features` MUST be enabled/disabled and configured as specified.

T `getPort(QName port, Class<T> sei, WebServiceFeatures... features)` Returns a proxy for the endpoint specified by `port`. Note that the namespace component of `port` is the target namespace of the WSDL definition document. The specified `features` MUST be enabled/disabled and configured as specified.

T `getPort(EndpointReference epr Class<T> sei, WebServiceFeatures... features)` Returns a proxy for the endpoint specified by `epr`. The address stored in the `epr` MUST be used during invocations on the endpoint. The `endpointReference` MUST NOT be used as the value of any addressing header such as `wsa:ReplyTo`. The specified `features` MUST be enabled/disabled and configured as specified. The `epr`'s `wsaw:ServiceName` MUST match the `Service` instance's `ServiceName`, otherwise a `WebServiceException` MUST be thrown. The `epr`'s `wsaw:EndpointName` MUST match the `PortName` for the `sei`, otherwise a `WebServiceException` MUST be thrown. If the `Service` instance has an associated WSDL, its WSDL MUST be used to determine any binding information, any WSDL in the `epr` will be ignored. If the `Service` instance does not have a WSDL, then any WSDL inlined in the `epr` will be used to determine binding information.

4.3 Add the following just before section 4.3.1

A JAX-WS implementation MUST honor all `WebServiceFeatures` (section 6.5) for Dispatch based applications.

4.5 Add section “`javax.xml.ws.EndpointReference`”

An `javax.xml.ws.EndpointReference` is an abstraction that represents an invocable web service endpoint. Client applications can use an `EndpointReference` to get a port for an SEI although doing so prevents them from getting/setting the `Executor` or `HandlerResolver` which would normally be done on a `Service` instance. The `EndpointReference` class delegates to the `javax.xml.ws.spi.Provider` to perform the `getPort` operation. The following method can be used to get a proxy for a `Port`.

getPort(Class<T> serviceEndpointInterface, WebServiceFeature... features) Gets a proxy for the `serviceEndpointInterface` that can be used to invoke operations on the endpoint referred to by the `EndpointReference` instance. The specified features **MUST** be enabled/disabled and configured as specified. The returned proxy **MUST** use the `EndpointReference` instance to determine the endpoint address and any reference parameters to be sent on endpoint invocations. The `EndpointReference` instance **MUST NOT** be used directly as the value of an WS-Addressing header such as `wsa:ReplyTo`.

5 Service APIs

5.1 Add the following just before section 5.1.1

A JAX-WS implementation **MUST** honor all `WebServiceFeatures` (section 6.5) for Provider based applications.

5.2.8 Add new section `javax.xml.ws.EndpointReference`

The following methods can be used on a published `Endpoint` to retrieve an `javax.xml.ws.EndpointReference` for the `Endpoint` instance.

getEndpointReference(List<Element> referenceParameters) Creates and returns an `javax.xml.ws.EndpointReference` for a published `Endpoint`. If the binding is SOAP 1.1/HTTP or SOAP 1.2/HTTP, then a `javax.xml.ws.wsaddressing.W3CEndpointReference` **MUST** be returned. If the `Endpoint` instance has an associated WSDL, then a returned `W3CEndpointReference` **MUST** in-line the WSDL in the `wsa:Metadata` and the `wsa:Metadata` **MUST** also contain the `wsaw:ServiceName` element with the `wsaw:EndpointName` attribute. A returned `W3CEndpointReference` **MUST** also contain the specified `referenceParameters`. An implementation **MUST** throw a `javax.xml.ws.WebServiceException` if the `Endpoint` instance has not been published. An implementation **MUST** throw `java.lang.UnsupportedOperationException` if the `Endpoint` instance uses the XML/HTTP binding.

getEndpointReference(Class<T> clazz, List<Element> referenceParameters) Creates and returns an `javax.xml.ws.EndpointReference` of type `clazz` for a published `Endpoint` instance. If `clazz` is of type `javax.xml.ws.wsaddressing.W3CEndpointReference` and if the `Endpoint` instance has an associated WSDL, then the WSDL **MUST** be in-lined in the `wsa:Metadata` and the `wsa:Metadata` **MUST** also contain the `wsaw:ServiceName` element with the `wsaw:EndpointName` attribute. A returned `W3CEndpointReference` **MUST** also contain the specified `referenceParameters`. An implementation **MUST** throw a `javax.xml.ws.WebServiceException` if the `Endpoint` instance has not been published. If the Class `clazz` is not a subclass of `EndpointReference` or the `Endpoint`

implementation does not support `EndpointReferences` of type `clazz` a `javax.xml.ws.WebServiceException` MUST be thrown. An implementation MUST throw `java.lang.UnsupportedOperationException` if the `Endpoint` instance uses the XML/HTTP binding.

6 Core APIs

6.2.2 Amend the description of the `createEndpoint` method

Change:

`createEndpoint(String bindingId, Object implementor)` Creates and returns an `Endpoint` for the specified binding and implementor.

To:

`createEndpoint(String bindingId, Object implementor)` Creates and returns an `Endpoint` for the specified binding and implementor. If the `bindingId` is `null` and no binding information is specified via the `javax.xml.ws.BindingType` annotation then a default SOAP1.1/HTTP binding MUST be used.

6.2.4 Add a section “Reading `EndpointReferences`”

`javax.xml.ws.EndpointReferences` can be created using the following method.

`readEndpointReference(javax.xml.transform.Source source)` Unmarshalls and returns a `javax.xml.ws.EndpointReference` from the infoset contained in `source`.

6.2.5 Add a section “Getting Port Objects”

The following method can be used to get a proxy for a Port.

`getPort(EndpointReference epr`

`Class<T> sei,`

`WebServiceFeature... features)` Gets a proxy for the `sei` that can be used to invoke operations on the endpoint referred to by the `epr`. The specified `features` MUST be enabled/disabled and configured as specified. The returned proxy MUST use the `epr` to determine the endpoint address and any reference parameters that MUST be sent on endpoint invocations. The `epr` MUST NOT be used directly as the value of an WS-Addressing header such as `wsa:ReplyTo`.

6.5 Add Section 6.5 `javax.xml.ws.WebServiceFeature`

JAX-WS 2.1 introduces the notion of features. A feature is associated with a particular functionality or behavior. Some features may only have meaning when used with certain bindings while other features may be generally useful. JAX-WS 2.1 introduces three standard features, `AddressingFeature`, `MTOMFeature` and `RespectBindingFeature` as well as the base `WebServiceFeature` class. A JAX-WS 2.1 implementation may define its own features but they will be non-portable across all JAX-WS 2.1 implementations.

Each feature is derived from the `javax.xml.ws.WebServiceFeature` class. This allows the web service developer to pass different types of `WebServiceFeatures` to the various JAX-WS APIs that utilize them. Also, each feature should be documented using JavaDocs on the derived classes. Each `WebServiceFeature` MUST have a public

static final String ID field that is used to uniquely identify the feature. This ID can be specified in the new Feature (see 7.8.1) annotation that is used in conjunction with the BindingType (see 7.8) annotation to enable or disable a feature.

Conformance (javax.xml.ws.WebServiceFeatures): Each derived type of javax.xml.ws.WebServiceFeature MUST contain a public static final String ID field that uniquely identifies the feature against all features of all implementations.

Since vendors can specify their own features, care MUST be taken when creating a feature ID so as to not conflict with another vendor's ID.

The WebServiceFeature class also has an enabled property that is used to store whether a particular feature should be enabled or disabled. Each derived type should provide either a constructor argument and/or a method that will allow the web service developer to set the enabled property. The meaning of enabled or disabled is determined by each individual WebServiceFeature. It is important that web services developers be able to enable/disable specific features when writing their web applications. For example, a developer may choose to implement WS-Addressing himself while using the Dispatch and Provider APIs and thus he MUST be able to tell JAX-WS to disable addressing.

Conformance (enabled property): Each derived type of javax.xml.ws.WebServiceFeature MUST provide a constructor argument and/or method to allow the web service developer to set the value of the enabled property. The public default constructor MUST by default set the enabled property to true. An implementation MUST honor the value of the enabled property of any supported WebServiceFeature.

6.5.1 Add Section 6.5.1 javax.xml.ws.soap.AddressingFeature

The AddressingFeature is used to control the use of WS-Addressing[33] by JAX-WS. This feature MUST be supported with the SOAP 1.1/HTTP or SOAP 1.2/HTTP bindings. Using this feature with any other binding is undefined.

Enabling this feature on the server will result in the wsaw:UsingAddressing element being added to the wsdl:Binding in the generated WSDL if the WSDL does not already exist for the endpoint and in the runtime being capable of consuming and responding to WS-Addressing headers.

Enabling this feature on the client will cause the JAX-WS runtime to include WS-Addressing headers in SOAP messages as specified by WS-Addressing[33].

Disabling this feature will prevent a JAX-WS runtime from processing or adding WS-Addressing headers from/to SOAP messages even if the associated WSDL had the wsaw:UsingAddressing element with the required="true" attribute. This may be necessary if a client or endpoint needs to implement Addressing themselves. For example, a client that desires to use non-anonymous ReplyTo can do so by disabling the AddressingFeature and by using Dispatch<Source> with Message mode.

The `AddressingFeature` has one property (`FeatureParameter`) required, that can be configured to control whether the generated `wsaw:UsingAddressing` element will contain the `required="true"` attribute.

The `AddressingFeature` can be automatically enabled if the `wsaw:UsingAddressing` extensibility element is in the `wsdl:binding`. Developers may choose to prevent this from happening by explicitly disabling the `AddressingFeature`.

6.5.1.1 Add section 6.5.1.1 `javax.xml.ws.EndpointReference`

The abstract `EndpointReference` class is used by the JAX-WS APIs to reference a particular endpoint in accordance with the W3C Web Services Addressing 1.0 [33]. Each concrete instance of an `EndpointReference` MUST contain a `wsa:Address`.

Applications may also use the `javax.xml.ws.EndpointReference` class in method signatures. JAXB 2.1 will bind the `EndpointReference` base class to `xs:anyType`. Applications should instead use concrete implementations of `EndpointReference` such as `javax.xml.ws.W3CEndpointReference` which will provide better binding. JAX-WS implementations are required to support the `W3CEndpointReference` class but they may also provide other `EndpointReference` subclasses that represent different versions of Addressing.

6.5.1.2 Add Section 6.5.1.2 `javax.xml.ws.W3CEndpointReference`

The `W3CEndpointReference` class is a concrete implementation of the `javax.xml.ws.EndpointReference` class and is used to reference endpoints that are compliant with the W3C Web Services Addressing 1.0 [33] and WS-Addressing – WSDL Binding[32]. When creating an `W3CEndpointReference`, if an associated WSDL is available, then the `W3CEndpointReference` MUST contain the WSDL in the `wsa:Metadata`. It MUST also contain the `wsaw:ServiceName` element with the `wsaw:EndpointName` attribute. The `wsaw:InterfaceName` MAY be present. Applications may use this class to pass `EndpointReferences` as method parameters or return types. JAXB 2.1 will bind the `W3CEndpointReference` class to the W3C `EndpointReference` XML Schema in the WSDL.

6.5.2 Add Section `javax.xml.ws.soap.MTOMFeature`

The `MTOMFeature` is used to specify if MTOM should be used with a web service. This feature should be used instead of the `javax.xml.ws.soap.SOAPBinding.SOAP11HTTP_MTOM_BINDING`, `javax.xml.ws.soap.SOAPBinding.SOAP12HTTP_MTOM_BINDING` and the `javax.xml.ws.soap.SOAPBinding.setMTOMEnabled()`. This feature MUST be supported with the SOAP 1.1/HTTP or SOAP 1.2/HTTP bindings. Using this feature with any other bindings is undefined.

Enabling this feature on either the server or client will result the JAX-WS runtime using MTOM and any binary data being XOP encoded.

The MTOMFeature has one property (FeatureParameter) threshold, that can be configured to control which binary data should be XOP encoded. The threshold is the size in bytes that binary data MUST be in order to be XOP encoded. The threshold MUST not be negative. The default value is 0.

Conformance (javax.xml.ws.soap.MTOMFeature): An implementation MUST support the javax.xml.ws.soap.MTOMFeature and its threshold property.

6.5.3 Add Section javax.xml.ws.RespectBindingFeature

The RespectBindingFeature is used to control whether a JAX-WS implementation MUST respect/honor the contents of the wsdl:binding associated with an endpoint.

Conformance (javax.xml.ws.RespectBindingFeature): When the javax.xml.ws.RespectBindingFeature is enabled, a JAX-WS implementation MUST inspect the wsdl:binding at runtime to determine result and parameter bindings as well as any wsdl:extensions that have the required="true" attribute. All required wsdl:extensions MUST be supported and honored by a JAX-WS implementation unless a specific wsdl:extension has been explicitly disabled via a WebServiceFeature. For example, if a wsdl:binding has a wsaw:UsingAddressing element with the required="true" attribute, WS-Addressing MUST be enabled and used unless the web service developer explicitly disables the WSAddressingFeature.

In order to not break backward compatibility with JAX-WS 2.0, the behavior with regards to respecting the wsdl:binding when this feature is disabled is undefined.

7 Annotations

7.8 Add features to BindingType annotation

Add the following property to Table 7.8

Property	Description	Default
features	Features to be enabled on the specified binding	{}

7.8.1 Add javax.xml.ws.Feature annotation

Features are additional functionality that can be enabled on a web service. Each feature defines its purpose and default behavior and can define any number of feature parameters. This annotation allows the web service developer to enable features and to configure them via FeatureParameters.

Add the following Table 7.8.1

Property	Description	Default
value	The unique identifier for the feature	""
enabled	Specifies whether the feature is enabled or not	true
parameters	An array of parameters for this feature. Each feature defines which parameters it has	{}

7.8.1.1 Add javax.xml.ws.FeatureParameter annotation

The FeatureParameter annotation is used to specify the values for a feature parameter.

Each feature defines any number of feature parameters.

Add the following Table 7.8.1.1

Property	Description	Default
name	The name of the parameter	""
value	The value of the parameter	""

The following is an example use of the BindingType annotation that enables WS-Addressing and MTOM and sets the MTOM threshold value to 1000.

```
@BindingType(SOAPBinding.SOAP11HTTP_BINDING,
    features={
        @Feature(AddressingFeature.ID),
        @Feature(MTOMFeature.ID,
            parameters={@FeatureParameter(
                name=MTOMFeature.THRESHOLD, value="1000")
            }
        )
    }
)
public class MyWebService { ... }
```

7.12 Add javax.xml.ws.Action

The Action annotation is used to generate the wsa:Action on wsdl:input and wsdl:output of each wsdl:operation mapped from the annotated methods.

Table 7:12

Property	Description	Default
input	Action for the wsdl:input operation	""
output	Action for the wsdl:output operation	""

7.13 Add javax.xml.ws.FaultAction

The FaultAction annotation is used to generate the wsa:Action element on the wsdl:fault element of each wsdl:operation mapped from the annotated methods.

Table 7:13

Property	Description	Default
value	Action for the wsdl:fault operation	""
className	Name of the exception class	No defaults, required property

9 Handler Framework

9.4.1.1 Standard Message Context Properties

Add the `javax.xml.ws.reference.parameters` property to Table 9.2.

Name	Type	Mandatory	Description
<code>javax.xml.ws.reference.parameters</code>	List<Element>	Y	A list of WS Addressing reference parameters. The list MUST include all SOAP headers marked with the <code>wsa:IsReferenceParameter="true"</code> attribute.

10 SOAP Binding

10.4.1.2 Add Addressing section

If the `javax.xml.ws.soap.AddressingFeature` is enabled, implementations are required to follow WS-Addressing[32,33,34] protocols.

Conformance (SOAP Addressing Support): An implementation MUST support WS-Addressing 1.0 – SOAP Binding[34].
